## Disposing Hazardous Waste

### Your hazard waste recycling

Did you know hazardous waste is any chemical or by product that can harm the environment and any living thing that gets exposed to it. These wastes are produced by manufacturing plants, agricultural processes and some household products.

There are 4 types of hazardous waste that can damage our environment and wellbeing.

- Reactive waste is those that can cause explosions when heated, mixed with water or compressed.
- Ignitable waste has flash points of less than 60 degrees and can combust and cause fires.
- Corrosive wastes are liquids capable of corroding metal containers.
- Toxic wastes can cause serious health problems and can even be fatal when ingested, inhaled or absorbed through the skin.

Hazard waste can be recycled and be converted into fuel.

## Protecting the planet from hazards

Bywaters' hazardous waste management service is not just about environmental sustainability, it is also about ensuring that your dangerous waste is handled safely and responsibly. With over 60 years of experience, you can be assured that your waste is in good hands.

Finding sustainable and safe solutions for hazardous waste disposal can be challenging. From aerosols to oil, each kind of hazardous waste poses unique difficulties and dangers, meaning you want an expert recycling provider handling any hazardous waste.

Bywaters supplies fully compliant and safety-tested containers for your hazardous waste and will develop a collection schedule based on your individual requirements, ensuring that each of your hazardous waste streams is reprocessed optimally for recycling in order to divert waste from landfill.
